"The reason for this unprecedented turn of events is simple — I am simply getting old and feel that my condition has deteriorated." Putin said at a news conference. He did not say when he would leave office. But in Russia, as in the United States, the presidency is not like a job for life, and succession is commonplace. The law allows Putin, who has served as president since 2000, to stay in the job until 2024. Putin's announcement did not come as a shock. But in Russia, where polls showed his approval rating had fallen sharply after a two-year-long political and economic crisis, the announcement gave rise to a sense of relief, even jubilation. To his critics, it was a painful but necessary reckoning with Russia's corrupt and authoritarian past. To his supporters, Putin represented a new beginning. As he announced his resignation, Putin seemed at peace with himself and his country. His decision came after weeks of rumors about his health that peaked last week when he canceled a long-planned trip to Moscow and was forced to miss several Cabinet meetings. He did not disclose any details of his medical condition.Q: CocoaPods: Set version of dependant library I would like to use a library that has a dependency on another version of the library. The scenario is very similar to the Flutter demo. Basically, I would like to use Material from 1.0.0 for the new widget and Material 1.1.0 for the existing widget. I am using a library that looks like this: def install pod "
