The most commonly used communication protocol for products is COM. AutoCAD also uses a number of interfaces to communicate with other software: XML format, Web Services, Inventor, Open Database Connectivity (ODBC), RFC Interface. AutoCAD supports the following drawing and drawing-related file formats, depending on the version: DXF and DWG (16 and 32 bit) BMP EPS GIF JPEG LAS PDF TIF PSD SWF Data storage AutoCAD stores all drawings in XML files. The initial design or drawing is stored in a compressed DXF file. The DXF file can be in one of three states: layout, editing, or validation. The layout state is where an object exists, but not necessarily has a model, material or other attributes that make up a particular object, or is otherwise not finalized for use in a drawing. The editing state is where an object is placed in a drawing, and its attributes are set, but it may not necessarily be drawn yet. The validation state is where an object has been drawn and is ready for saving, but has not yet been imported. The file is later updated by a user when the object is drawn or manually edited. Some AutoCAD features can only be used in the layout state. These include the dimensioning tools, the automated repair tools, and the labeling. If the file is in the editing state, some commands can be used for editing, e.g., the Object Properties. Other commands will not work, e.g., Dimension and Repair. If the file is in the layout or editing state, some commands can be used for validation, e.g., Generate MText objects. Other commands will not work, e.g., Dimension. This is a list of features of AutoCAD that can only be used in the layout state: AutoCAD Foundation classes for digital surveying (DGS) BIM (Building
